

Wall Shear Stress Distribution in the Human Circulatory System

Color intensity represents WSS magnitude (logarithmic scale, 0.1–1000+ dyne/cm²)

Wall Shear Stress Reference Data

	Hepatic Sinusoids	0.1–0.6	Ultra-low; fenestrated endothelium; NP access
	Lymphatic Vessels	0.1–0.6	Near-stagnant drainage flow
	Venous Circulation	1–6	Low-pressure, high-capacitance return
	Atherosclerotic Sites	0.5–4	Pathological; promotes plaque formation
	Carotid Arteries	10–20	Maintains endothelial homeostasis
	Arterioles	40–60	High shear drives NP margination
	General Arterial	10–70	Pulsatile systemic circulation
	Stenotic Regions	100–1200+	Extreme shear; bilayer rupture risk
		dyne/cm ²
